VISCOSIMETER TYPE STEINHALL

Viscosimeter type Stein Hall is worldwide used for the control of the viscosity of starch adhesives, widely used for the production of corrugated fibreboard.

Viscosity is a key property of starch adhesives because it is strictly related to the production and quality control of corrugated fibreboard.

Viscosity is directly related to the starch content, the water penetration, water retention, thack, film formation and transference to the fibreboard.

Its rugged construction and its extremely easy operation enables the realization of quick and precise tests at site, where the critical stages of production are located.

Features

Manufactured in stainless steel. It has a comfortable grip and two pointers that offers perfect indication of the measurable volume of starch adhesive inside the measuring cup.

The calibrated orifice is located in a plate precisely positioned and fixed by means of a special nut. It can be easily disassembled for cleaning the adhesive after the measurements are done.
